USB 3.0 Express™ Drive Upgrade Instructions

The following procedure will guide you through upgrading the firmware on your USB 3.0 Express Drive.

Please note: this is a destructive upgrade – you need to backup your data.

The new firmware enables the Express drive to run cooler and formats the drive as a single partition (no CD-ROM partition).

How to Update your drive:

1. Insert USB 3.0 Express Drive into available USB port
2. Turn off the FNET driver (if installed)
    - Located in the System Tray when installed (lower right, near clock)
    - Right-click the "TurboHDD USB" icon and choose "exit TurboHDD USB"
3. Open the folder labeled "STT_Express_Updater_082410"
4. Run this file

STT_Express_Updater_082410
7z Setup SFX
Igor Pavlov

The setup program will automatically interrogate your drive and format it to the correct capacity. When finished you will have a single partition drive with updated firmware.

Now to get the turbo driver back…..

1. Copy the other folder labeled "Express Turbo Driver.zip" to your drive

2. Run the setup file

Setup
FNet Co., Ltd.

The driver will now be installed on your machine and automatically run each time you re-insert the drive. Note: you will need to install this driver on each PC that you use to get accelerated performance.

Done.

Post any issues and successes on the Forum.

I will monitor it closely to make sure that everyone has a successful upgrade experience. If you are successful but found a step confusing or missing, please post that as well to help our growing USB 3.0 family.

Thank you for your purchase. Enjoy.
